

When you need us...

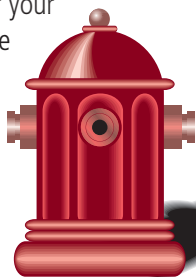

...We're always close at hand.

Homes and businesses in our community are always close to a plentiful supply of water if a fire should occur. That's the way we planned it. In fact, the need for fire protection is built right into your water system.

The capacity of our water tanks and pumping facilities and the size of our water mains are determined with fire protection in mind. In many instances, for example, water mains could be half the size if we didn't need to figure in the need for fire protection. We've also installed fire hydrants throughout the community to provide our fire department with a ready supply of water for fire fighting.

We consider ourselves a partner with local fire departments to help residents keep their home insurance rates down.

The water used for firefighting is provided for free. At the same time, part of the rate you pay for your water is used to build and maintain the infrastructure necessary for fire protection. Behind every fire hydrant is the infrastructure you need to protect your home in case of a fire.
